1 Project Overview

This project aims to develop a synthesizer and sequencer—aka a digital audio workstation (DAW)—for any device capable of running a modern web browser supporting WebAudio, using the emscripten compiler toolchain that turns C++ DSP code into efficient WebAssembly. The goal is to make sound and music production more accessible, because any device capable of running a modern web browser will be able to use this DAW, not just computers or tablets running OS-dependent and discrete, native DAW applications.
